

SURGERY PROTOCOL FOR ADULT ADRENAL INSUFFICIENT PATIENTS

by Paul Margulies, MD, FACE, FACP
(Amended 8/31/2020)

Steroid coverage for adult adrenal insufficient patients needing surgery is infusing 200 mg hydrocortisone over 24 hours after an initial bolus of 50-100 mg, then taper or resume the normal dosage depending on the surgery. If major surgery is performed, a slow taper is used; if minor, resumption to normal dose within a day is fine. If the surgery itself is very minor, like an outpatient biopsy, just using a double oral dose of hydrocortisone may be sufficient coverage.
